

SS 457 / ASTM F1487 Playground Inspection Services

SS 457 / ASTM F1487 – Specification for Playground Equipment for Public Use is the standard that establishes safety requirements for the design, installation, inspection and maintenance of playground equipment.

It aims to reduce the risk of injuries by ensuring playgrounds remain safe, reliable and suitable for public use.

Regular playground inspections are essential to identify hazards arising from wear and tear, weather exposure, vandalism and frequent use. Routine inspections also help owners maintain compliance with safety requirements, improve user safety and extend the service life of playground equipment.

At Singapore Test Lab (STL), we provide professional SS 457 / ASTM F1487 playground inspection services for schools, childcare centres, condominiums, parks, town councils, property developers and facility management companies.

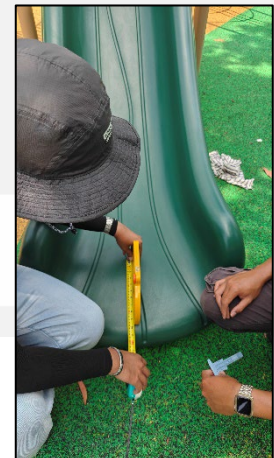

Our Certified Playground Safety Inspectors (CPSI) perform comprehensive on-site assessments using specialised gauges, probes and measuring instruments to evaluate the condition and safety of playground equipment.

We will check for entrapment and entanglement hazards, protrusions, sharp edges, moving components, safety clearances, use zones, playground layout, surfacing system and overall equipment condition.

Upon completion, we provide a detailed inspection report with our findings and recommendations to assist clients in planning maintenance, repairs and corrective actions.

By engaging STL, you benefit from independent, professional inspectors with vast experiences that support compliance, enhance playground safety and help protect children and give care givers peace of mind.

A safe playground starts with a thorough inspection. Partner with STL for reliable playground inspection services. Contact us today for a consultation or quotation.
