

Scaffolding Testing SS 280, SS 311— Safety Starts with Reliable Testing

Scaffolding is an essential part of Singapore's construction industry, providing temporary access and working platforms for construction, maintenance, shipbuilding and industrial projects.

Because scaffolding systems are exposed to heavy loads, repeated use and demanding site conditions, proper testing and verification are critical to protecting workers and ensuring structural reliability.

In Singapore, where construction activities take place in highly demanding environments, reliable scaffolding is an important part of workplace safety.

Singapore Test Lab (STL) provides scaffolding testing, supporting manufacturers, suppliers, contractors and project owners in evaluating scaffolding components and systems against applicable Singapore Standards (SS) and relevant international standards.

Any failure involving a scaffold component can result in serious injuries, project disruption and significant financial consequences.

Independent scaffolding testing provides objective evidence of structural strength, load-bearing capacity and reliability under specified conditions.

Testing supports product qualification, compliance, technical documentation and quality assurance, giving manufacturers, contractors and project owners greater confidence that critical scaffolding components meet required performance criteria before being placed into service.

Choose STL for professional scaffolding testing and technical evaluation. Our laboratory combines testing expertise, engineering knowledge and standards-based assessment to help businesses demonstrate the quality, strength and reliability of their scaffolding products.

Whether you are developing a new scaffolding system, importing components, supplying construction projects or verifying existing products, STL can help you test with confidence and build with safety in mind.
